v.	Reasoned statement under Article 35(2) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement					
1.	Statement					
	Novelty (N)	Claims	1-14	YES		
		Claims		NO		
	Inventive step (IS)	Claims	1-13	YES		
		Claims	14	NO		
	Industrial applicability (IA)	Claims	1-14	YES		

2. Citations and explanations

The numbering (D1, D2) used for the searched prior art documents corresponds to the order in which they are listed in the international search report.)

Claims

The closest prior art, D1 (abstract), describes very generally the simple and reliable removal of polymerization inhibitors, which are not described in more detail, from various vinyl monomer systems, inter alia by adsorption, and mentions inter alia also activated carbon in a series of possible absorbents.

In relation thereto, the method claimed in the present application differs by the specification of a combination of particular method parameters:

method for the reduction of the concentration of methoxy-hydroquinone (MEHQ) in acrylic acid, which is neutralized up to 75% to 105%, by the continual adsorption of activated carbon.

This combination of features cannot be derived from D1 or any of the other (published) documents D2 to D5 cited in the search report, and the subjects of the present claims 1 to 14 are therefore novel (PCT Article 33(2)).

International application No. PCT/EP 03/13621

Furthermore, D1 is not constituted in such a way that it could have readily led a person skilled in the art to the claimed specific procedure. This is even more so the case since surprisingly advantageous adsorption conditions were found, in a limited range, with the procedure according to the invention (see page 6 of the description, page 2).

The claimed method is also not obvious from the combination with D2. D2 describes namely inter alia the removal of hydroquinone or quinone derivatives from vinylic compounds, including inter alia acrylic acid (column 3, line 13); however, said polymerization inhibitors should have at least three rings (claim 1). In particular D2 also does not hint at the relevance of the neutralization degree of acrylic acid as the medium to be purified.

The prior art described in D3 to D5 is even more remote.

The claimed method of reducing the concentration of MEHQ can therefore be regarded as involving an inventive step (PCT Article 33(3)).

This applies correspondingly also to the method of producing superabsorbers (claim 13), which method is characterized substantially by the method of reducing the MEHQ concentration included therein.

The use of 'superabsorbers', whether yellow or colorless, is already basically known in the hygiene industry for producing various types of diapers and pads (see the introductory part of the present description). It is therefore not discernible how this per se known method according to the present claim 14 could substantiate the required inventive step, especially since a 'surprising' effect associated with the use is not discernible.

International application No. PCT/EP 03/13621

There are no objections regarding the industrial applicability (PCT Article 33(4)) of the claimed subject matter.
